Editor's Note

Isn't it time that you watch television on your own time? As I know from my own personal DVR experience, if you find the right DVR, you can certainly do that and a lot more. These days, DVRs are no longer limited to recording your favorite programs while collecting dust next to a TV. These devices have plenty of other features to offer, such as the ability to stream video, music, or photos on your home network; download media from the Internet; offload recordings to an external hard drive; or record HD content. In this month's feature package, "All About DVRs," which starts on page 44, we take a look at what today's DVRs have to offer and what you should consider before purchasing one.

As always, *First Glimpse* strives to provide you with the latest information on new products hitting store shelves, and our growing "Latest Arrivals" (see page 5) is one way we try to alert you to these items. In addition to this page chock-full of new products, I suggest you take a look at our new "Software Listings" on page 68. This two-page article gives an overview of the most noteworthy and popular software with snippets of helpful buying information. Now you'll know exactly what you need for your PC.

Emergency Alerts Coming To Cell Phones

The FCC (Federal Communications Commission) is working on plans for a national mobile alert system. The CMAS (Commercial Mobile Alert System) will allow cell-phone service providers to send emergency text-message alerts from the government by 2010. Alerts will fall into three categories: presidential alerts, imminent threat alerts, and Amber alerts. Cell-phone service providers that want to participate in the service will have 10 months to upgrade their networks. The service will also require consumers to buy a new phone with a special chip that allows delivery of the one-to-many broadcast text alerts. This is different from the one-to-one SMS messages cell-phone users currently send and receive.

VZ Nav Adds Traffic Alerts

Version 4 of Verizon Wireless' VZ Navigator service became available in April on select cell phones and Windows Mobile devices. The service gives users in 75 U.S. cities real-time access to traffic information, as well as a movie and event finder, weather reports, and gas prices at nearby stations. VZ Navigator users can get a subscription with unlimited access for \$9.99 per month. Current VZ Nav subscribers are eligible for a free upgrade.

Pinnacle's PCTV: HDTV On Your PC

A new addition from Pinnacle Systems follows the high-def path most components are taking these days. The PCTV HD Stick (\$69.99; www.pinnaclesys.com) and HD Pro Stick (\$99.99) are TV tuners for your PC, meaning they deliver free digital high-def and standard-def, OTA (over-the-air) television programming to your computer. You'll simply plug the device, which is about the size of a flash drive, into a PC's USB port to enjoy HDTV on your computer. The HD Sticks are ideal for on-the-go laptop users and Windows Vista and XP Media Center users who didn't get a TV tuner with their systems.

Worldwide PC Shipments Grew In First Quarter

According to preliminary results from Gartner, the U.S. recession had a moderate effect on PC shipments in this country in the first quarter of 2008, but nothing more than analysts had expected. The recession seems to have had little effect on global shipments, though, which were up 12.3% from the first quarter of 2007 for a total of 71.1 million units. PC shipments in the United States reached 15.2 million units in Q1 2008, up 3% from the same period last year.

	Global PC Shipments (in millions of units)	Q1 2008 Growth from Q1 2007
United States	15.2	3%
Europe/Middle East/Africa	24.8	14.9%
Asia/Pacific	19.1	19%
Latin America	6.3	19.1%
Japan	4.1	0.6%

Social-Networking Sites More Than Fun Fad

If you are under the age of 20, you're almost certainly a member of one of the many online social-networking sites such as Facebook or MySpace. What started as a way for teens to "hang out" online has turned into something of a new social phenomenon that also appeals to older, business-oriented clientele. Many enterprise users are finding uses for social-networking sites. In 2006, IDC projected that the enterprise social-networking market would grow 120% from \$46.5 million. Actual 2007 numbers showed growth of 191% to \$135.3 million.

Social Networking Market Growth Outpacing Projections

Market size in 2006	\$46.5 million
Projected in 2006	N/A
Market size in 2007	\$135.29 million
Projected in 2007	\$102.3 million
Projected market size in 2012	\$1.25 billion

Your PC Needs A Checkup

Get Rid Of Digital Spies

PC Tools Spyware Doctor
\$29.95 • www.pctools.com

information. For instance, Spyware Doctor can block attempts to record your keystrokes, perform suspicious changes to your Web browser settings, open unsafe attachments, or hijack your network connection. With access to PC Tools' up-to-date Infection Database, Spyware Doctor is also more capable than free-ware of removing tricky threats.

Tell Me Where It Hurts

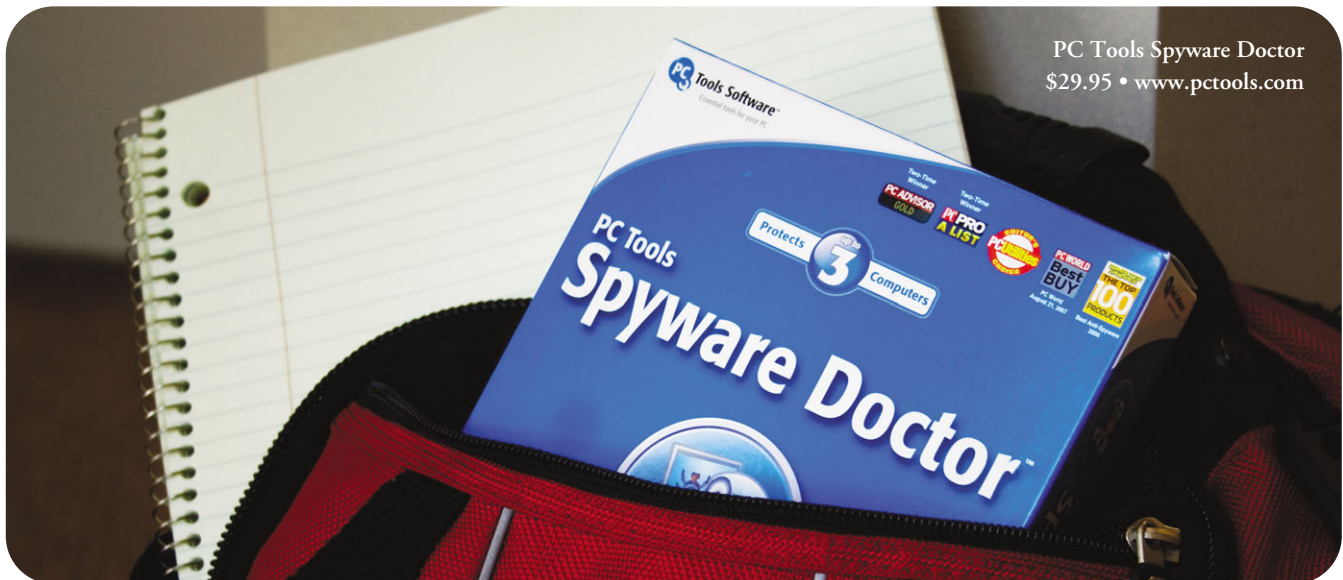

Performing a system scan is as simple as opening the software, selecting Start Scan, and clicking the Scan Now button. Spyware Doctor offers three different types of scans: Intelli-Scan (a quick scan that only inspects the locations where malware is typically found), Full Scan (a thorough examination of the files in all drives, applications, and other locations where malware resides), and Custom Scan (perfect for checking specific folders or data stored on your home network).

Spyware is potentially the most dangerous form of malware on the Internet. Rather than damaging your PC as viruses do, spyware lurks in the shadows of your operating system to gather personal information about you, such as your usernames, passwords, and financial information. Spyware designers also have a number of tricks at their disposal to track your computer activity. From monitoring your keystrokes to examining the cookies saved

by your Web browser, the sophistication of modern spyware means that you'll need a security tool that's dedicated to exterminating the sneaky software.

Spyware Doctor from PC Tools deeply scans your system to find the malware that's difficult to track down, including rootkits—programs that secretly modify Windows to gain access and cloak their detrimental actions. And while many free, downloadable antispyspyware applications stop at detection and removal, Spyware Doctor also prevents spyware—in real time—from accessing and sending out

Because nothing's more annoying than when your PC slows to a crawl during a security scan, Spyware Doctor is designed to run without bogging down your computer activity. Note that a Full Scan will take more time than an Intelli-Scan, but the deep scan offers you better protection. If you find that you don't always have time to run a Full Scan, you can take advantage of Spyware Doctor's Scheduled Tasks feature, which lets you configure Spyware Doctor to run a Full Scan whenever it's most convenient for you, such as when you're at work or asleep.

Take Action

When a scan finishes, you can choose to quarantine or remove any found malware infections. The Quarantine option allows Spyware Doctor to keep threats under wraps without removing files you need on your PC. If any files turn out to be necessary, you can open the Quarantine list and select the Restore button to make certain files accessible again. The Quarantine list is also a handy way to examine where malware infections originated, which helps you avoid infected Web sites in the future.

Preventive Medicine

Spyware Doctor offers a comprehensive set of real-time tools to stop hidden malicious software from exploiting your PC data and Web access. The newest version of Spyware Doctor, version 5.5, also supports Behavior Guard, an innovative add-on that lets you keep tabs on spyware.

Traditional security tools use a threat database to identify spyware, but as spyware variants grow, it becomes difficult for spyware experts to update the database. Behavior Guard monitors all the

programs running on your PC and notes any suspicious actions, such as attempts to conceal detrimental activities or transmit confidential files. One questionable behavior may not trigger an alert, but once enough evidence accumulates, Behavior Guard will stop the application and clean up the files the program attempted to infect or change. This behavior-based approach means that Spyware Doctor can protect your PC against more than just known threats.

Find The Cure

With Spyware Doctor's one-year software subscription, you will have access to all PC Tools' software and spyware database updates. You can also use Spyware Doctor on up to three different computers. With vital updates and loads of features, Spyware Doctor is an antispyware tool that can virtually maintain itself and keep your PC free of any nasty infiltrators. **FG**

Behavior Guard: True Behavior-Based Protection

Even if you regularly update your antispyware, applications relying solely on threat databases can't recognize spyware that's too new to add to the database—leaving your computer open to emerging infiltrators. Behavior-based detection, such as PC Tools' Behavior Guard, is the next evolution in malware detection. This software add-on can identify threats (both known and unknown) based on patterns of suspicious activity.

Some antispyware tools may claim to have behavior-based detection, but almost exclusively, this refers to Heuristic Analysis, which compares a suspicious file to the code and functions of known threats. Heuristic Analysis is likely to miss malware that operates in a new way or uses new code. Behavior Guard, which will be a standard feature in the 2009 release of Spyware Doctor, provides true behavioral protection against today's advanced malware threats.

Your Options For Super Sonics

Don't Miss These Audio Details

The sound of a film or TV show can add suspense, underscore a character's emotions, and portray the environmental aspects of a scene. If the speakers integrated in your HDTV are providing only muffled elements of these audio details, then you may want a home-theater audio system, which can give you the depth and realism you want. Generally, audio systems are broken down into three categories: 5.1 channel, 2.1 channel, and sound bars. We'll explain the differences and help you determine which type of audio system suits you best.

5.1 Channel

Most DVDs and BDs (Blu-ray Discs) offer at least one 5.1-channel mix, which means that a sound engineer has created five distinct tracks of audio and one channel for bass effects. A 5.1-channel surround system includes five

speakers—one for each audio track—and the .1 subwoofer to produce the deep bass sounds. By placing the five speakers around your listening area, you'll experience the enveloping audio you hear in a movie theater.

Because the speakers physically surround you, 5.1-channel systems offer more realistic surround-sound effects than the virtual surround sound of 2.1-channel and sound bar systems. In short, if your audio priority is movie-theater sound, a 5.1-channel system is the way to go. The only downside is that, for best results, you'll need to appropriately position the five speakers, which may adversely affect the room's aesthetic appeal.

2.1 Channel

A 2.1-channel system consists of two stereo speakers and one subwoofer. If you don't have space for five speakers, a

2.1-channel system creates a sound stage that's comparable to 5.1 models, and you won't have to conceal long runs of speaker wire.

Although 5.1 systems have more speakers, a 2.1 set with high-quality speakers may sound more vibrant and rich than 5.1 systems that use lower-quality speakers. And using the virtual surround-sound technology built into the A/V receiver, many 2.1 systems do a decent job of tricking your ears into believing sound is coming from all corners of the room.

Sound Bars

These one-piece wonders are ideal if you want excellent sound quality without dealing with cabling concerns or boxy speakers. Sound bars offer a slim, horizontal design that's less obtrusive than traditional speakers, and many of the combo systems can be wall-mounted to match the style of a mounted, flat-panel HDTV.

Sound bars imitate surround sound by delaying parts of the audio and tweaking volume through either audio processing or sound-wave reflections. If you have an open floor plan, avoid models that rely on sound-wave reflection because you may miss the virtual surround effects. Sound bars have the ability to produce some bass, but if you prefer booming sound in your movies and music, many models come with or offer inputs for a traditional subwoofer. **FG**

Your Home Theater Go-To Guys

Best Buy's Home Theater Installation Services

Back in the day, setting up a TV was a cinch, but it's complicated now. The Geek Squad Home Theater Installation service lets you sit back and envision your ultimate viewing and listening environment, while leaving the design, configuration, and installation to the Geek Squad's trained experts.

In-Home Consultation

The Geek Squad offers an in-home consultation service. Schedule an appointment by calling 1-800-GEEK SQUAD (1-800-433-5778) or by visiting your local Best Buy and speaking to a customer specialist.

The Geeks spend roughly an hour helping you build your dream A/V system. The experts perform a preliminary walkthrough of your home, discussing with you the possibilities and offering advice on choosing products that meet your needs. The cost of the service, which includes a detailed estimate of costs and a diagram of the proposed layout, is \$100. If you buy your equipment at Best Buy and spend more than \$499, you can apply the cost of your consultation toward the purchase.

In-store experience. Many Best Buy stores feature a Magnolia demo room, in which you'll see and hear what a high-performance home-theater setup should look and sound like in a comfortable living room-like setting. A Geek Squad expert will ascertain what it is that you want

Available Services

Geek Squad offers a range of flexible and comprehensive services to help you realize your ideal home-theater system.

- Consultation
- Delivery and setup
- TV mounting
- Speaker installation
- Universal remotes
- Home theater calibration

from your home-theater system. They'll also make sure you'll have the proper cables and accessories to make it work, as well as ensure you're informed about the product. For instance, if you purchase a new HDTV, the Geek Squad can inform you about the local availability of digital cable, satellite, and over-the-air services.

In-home installation. The Geek Squad's basic TV & Video Setup costs \$150 and includes the plugging in, configuring, and setting up of three select video components. Add audio integration for another \$50, bringing the Home Theater Setup to \$200. Other services, such as calibration, remote control programming, and stand assembly, are available, as well.

One-Stop Shop

You already know that you can get the products you want at Best Buy, and now you know that you can get it all

Price Breakdown

Geek Squad offers a fairly complete list of professional installation services that feature a clear pricing scheme so you can make sure you get a system that fits your lifestyle and your budget.

Essential Things To Know

Home Theater

Universal Remote Controls

How does a universal remote improve my home-theater experience?

ANSWER: You won't need to grab several remotes each time you want to watch a movie or TV show. Also, some universal remotes simplify a sequence of actions that run with the push of a button.

Can a universal remote control all of the components in my home theater?

ANSWER: Yes, universal remotes are either programmable or preprogrammed with control codes for thousands of home-theater components.

Will a universal remote offer the same features found on my original remote?

ANSWER: Many universal remotes have the ability to learn commands from previous remote controls, which lets you add missing functions. Look for a learning model for maximum compatibility.

If I'm using a universal remote for multiple devices, will I have buttons for all of those devices?

ANSWER: Depending on which device you want to control, a remote with an LCD will let you select from a variety of controls that are specific to the device.

Speaker Systems

How should I compare speaker systems I'm considering purchasing?

ANSWER: Use actual CD/DVDs from your media library to hear how the speakers perform. At an A/V store, ask if a listening/testing room is available. At an electronics store, ask to turn surrounding systems off temporarily while testing.

What should I listen for audio-wise when testing a speaker system?

ANSWER: Foremost, listen for audio that pleases your ears. Test also for high volume support without distortion; front speakers that don't compensate for a weak subwoofer; lush, deep, lively basses; bright, clear, crisp midtones; and distinct, non-tinny highs.

How long should a speaker system last?

ANSWER: Getting 20 or more years from a quality speaker system isn't unheard of. In fact, many audio-visual experts consider speaker systems among the best long-term investments among all consumer electronics.

How do I estimate how much speaker wire I'll need?

ANSWER: Measure the distances from your A/V receiver to where you'll place each speaker and add 6 to 10 feet to each distance to allow enough slack to conceal the wires under floorboards or weave around obstacles.

DVRs

Do I need a satellite or cable subscription to use a DVR?

ANSWER: Only in the case of certain DVRs; for example, DirecTV brand DVRs require a subscription to DirecTV service, while other brands such as TiVo are service agnostic.

How many hours of TV can I record on a DVR?

ANSWER: It depends on the size of the DVR's hard drive and whether you record SD or HD programming. Some DVRs will conveniently specify size in hours instead of gigabytes.

What's the difference between DVR and DVD-R?

ANSWER: A DVR is a device that records content from your TV to its own hard drive. A DVD-R is a DVD recordable format.

What features differentiate TiVo receivers from one another?

ANSWER: There are three TiVo DVRs: the original, Series 2, and Series 3. Differences include storage capacity, the ability to pause live TV, and being able to record more than one program at a time.

Flat-Panel TVs

Why should I buy an HDTV?

ANSWER: An HDTV provides a wide screen for movies, plus a more detailed picture for Blu-ray Discs and high-def TV channels. Some also have a tuner for digital broadcasts.

What are 1080, 720, and 480?

ANSWER: These numbers represent video resolutions by their picture height. High-def 1080 video is 1,920 pixels wide by 1,080 pixels high; high-def 720 video, 1,280 x 720; and standard DVD/TV is 720 x 480.

What do the "i" and "p" stand for in 720p, 1080i, and 1080p?

ANSWER: These letters indicate whether an HDTV displays each frame of the picture all at once (progressive scan) or alternates odd and even horizontal lines of pixels (interlaced). Usually, progressive scan is the preferred option.

Do I need a built-in tuner in a new HDTV?

ANSWER: Yes, if you plan to watch broadcast digital channels using an antenna. If you only watch cable or satellite channels, you don't need a tuner. HDTV tuners should be ready for the FCC-mandated shift to digital broadcasting.

Yes, You Need To Calibrate

Give Your HDTV A Makeover

It's probably for the best that we consumers don't have access to the settings that will make our HDTVs look their best. Sure, you can use a calibration disc, but chances are good that the TV's menu controls won't let you do everything those discs suggest you do. The advanced stuff requires a trip to the HDTV's service menu, which is accessed by punching a secret code into your remote control. We don't advise that you do so, however, because you can ruin your TV.

The HDTV manufacturers keep the code a secret for a reason: Poking around in the wrong places can have devastating consequences. "Consumers should never go into the service menu," says Ira George, an ISF-certified Elite Services Specialist for Geek Squad (www.bestbuy.com; go to TV & Home Theater Installation) in Omaha, Nebr. "If they don't know what they're doing, they will render the TV useless."

Indeed, one ISF-certified calibrator we spoke with years ago during a calibration session told us the sad tale of a customer who entered the service menu

and accidentally turned off the electron guns used to display an image on the screen. He couldn't see anything—including the service menu—and his television was essentially broken until the ISF calibrator arrived to save the day.

As if going into the service menu isn't perilous enough, there's not much the average consumer can do once they get there. You need pricey equipment to adjust the settings found there—exactly the kinds of equipment ISF-certified calibrators have. "We use calibration equipment provided by Sencore," says George. "It is a color analyzer that is used to set the white balance of the customers' displays. Without that equipment, customers cannot accurately set the colors of their televisions."

There are only a few downsides to calibration. The first is that it can't be done right out of the box. "It is recommended that the TV have at least 100 hours of use before a calibration can be performed properly," says George. There also are a few things calibration can't overcome. "Calibration cannot correct alignment issues in rear-projection TVs," George says. "Calibration also cannot correct any service issues with the TV."

Although you can expect to budget 10 to 15% of the purchase price of your television for a professional calibration session, consider it an entertainment investment that will pay dividends for years to come. **FG**

What To Expect From A Calibration

If you decide to call in the Geek Squad Home Theater Calibration team to calibrate your HDTV, you can expect the techs to establish maximum contrast between black and white, so images

look their best and retain maximum detail. The ISF-certified Elite Service Specialist will also use color analyzer equipment to objectively tune color saturation and temperature as precisely as possible,

letting you see video exactly the same way that the person creating it did.

A calibration session includes two inputs on the set, so if you have a DVD player and cable box, for example, the HDTV's inputs will be calibrated specifically for the video output from those two devices. Calibration also adjusts the sound levels and positioning of the speakers in a surround-sound setup, so your entire home theater will look and sound as good as it can. ●

Going Digital

How Will The Upcoming TV Conversion Affect You?

ital TV) signals.

n Feb. 17, 2009, television broadcasters across the nation will begin sending out their programming via DTV (digital TV) signals.

Why Digital?

Analog broadcasts have worked well for a long time, so many wonder why we have to make the switch at all, let alone next year. There are a variety of reasons to go digital, but the primary one is to conserve what has quickly become one of our most precious natural resources: radio spectrum. There's a fixed amount of spectrum, meaning there are only so many frequencies available to handle television, radio, cell phone, networking, emergency, and other wireless traffic.

Analog and digital transmissions eat up the same amount of bandwidth, but there's a big difference between the two technologies. Digital transmissions can have compression and other techniques applied that are off-limits to analog transmissions. These tricks let broadcasters

squeeze several digital channels into the same amount of bandwidth that one analog channel requires. This is important where HDTV broadcasts are concerned because HDTV transmissions require more bandwidth than standard-definition channels. We have no way to increase available radio spectrum, so we must decrease the amount of spectrum each channel requires. Digital is vital today, where hundreds of channels must coexist.

What About Analog?

An analog TV can't use a digital signal. A DAC (digital-to-analog converter) must receive the incoming digital signal, convert it to analog, and output the signal to your analog TV. If you have an analog TV and subscribe to cable or satellite (digital or otherwise), you already have the hardware that incorporates a DAC—so few of us will notice the difference once the content switches to all-digital.

If you're using an antenna to pull in free OTA (over-the-air) broadcasts, you may have a problem. Right now, broadcasters transmit digital and analog OTA signals simultaneously, but on Feb. 17, 2009, the

analog transmissions will stop. If your TV has an analog tuner, you'll need a DAC box to convert the digital signal. If your TV has a digital tuner, however, you'll be able to enjoy OTA broadcasts. Check out the "Are You Ready For DTV?" sidebar for a convenient breakdown.

If your TV was manufactured after March 1, 2007, it has to have a digital tuner. Otherwise, check the manual or call the manufacturer to see what type of tuner is installed. Keep in mind that even if you have a digital HDTV, it may still have an analog tuner, as crazy as that sounds.

DACs will be available when the switch is made, but they won't be free, the NTIA (National Telecommunications & Information Administration) is subsidizing the cost. The most important thing to keep in mind before the transition is that there's no need to panic. Your old TVs won't become worthless, and new TVs will be ready to go once the digital switch is thrown, without you needing to buy any additional hardware, cables, or other accessories. **FG**

BY TRACY BAKER

Are You Ready For DTV?

Most of us are already prepared to usher in the age of all-digital television, but refer to this chart for each television you have in the house to see what type of hardware you need come Feb. 17, 2009.

What Tuner Type Does Your TV Have?	How Do You Receive Your TV Signal?	What You Need For The DTV Transition:
An analog tuner	Over-the-air	A DAC (digital-to-analog converter) box
An analog tuner	Via cable or satellite service	Your existing cable or satellite equipment
A digital tuner	Over-the-air, cable, or satellite service	Nothing extra at all

The Goods On LCDs, Plasmas & RPTVs

BY KATHRYN DOLAN

LCD

Pros

- Thin profiles and light weight make these televisions easy to mount on a wall.
- Power demands are a bit lower than comparably sized plasma displays and considerably lower than CRTs.
- Many LCD TVs have a VGA input, so you can hook up your computer and view content on a big, bright screen.
- Altitude and air pressure have no effect on LCD TVs, so performance doesn't suffer in the mountains.
- Crystals untwist to block unnecessary white light, so there's no glare, making LCD TVs ideal for sunny rooms and brightly lit areas.

Cons

- Fast-moving images may suffer from a slight trailer-effect, but as LCD technology has improved, the effect is barely perceptible.
- When pixels stick on or off, they show up as either a pinpoint of bright light or black and can be distracting on-screen.

Best For

- Bright, sunny kitchens
- Small rooms

Plasma

Pros

- Plasma TVs light phosphors evenly across the screen to create images, and the images are consistently bright and clear with vibrant colors.
- The contrast ratio is high (3,000:1), so you'll see deep, dark blacks and bright, crisp whites.
- The design and technology lend themselves to large screen sizes—typically 50 inches or greater.
- Rapid pixel response means no blurry images.
- Wide-viewing angles gives you the same, high-quality images on-screen no matter where in the room you're sitting.
- Because of the way the electrical pulses excite the gases, a plasma TV retains its bright colors and high contrast ratio in dimly lit rooms, making a plasma TV ideal for home-theater rooms with little ambient light.

Cons

- Because the screens are typically over 50 inches in diameter, plasma TVs consume roughly one-third more energy than same-sized LCD TVs, but it's still less than CRTs.
- A combination of low air pressure and high altitudes (6,500 feet and higher) may cause plasma TVs to buzz.

Best For

- Movies with nonstop action
- Sporting events

RPTV

Pros

- Although often heavier than their LCD and plasma counterparts, RPTVs are surprisingly lightweight for their sizes. For example, a 73-inch DLP (digital light projector) RPTV weighs only 93 pounds.
- You'll find exceptional picture quality on very big screens (65 inches and up).
- As screens get bigger, RPTVs are more cost-effective than LCD or plasma TVs.

Cons

- With depths of 16 to 24 inches, these TVs are far too big and bulky to mount on a wall.

Best For

- Big, roomy home theaters
- Movies and games

5 Must-Have Accessories

As you head toward the HDTV section of your local consumer-electronics store, you'll invariably pass shelves of bland-looking HDTV accessories.

Sure, these accessories have multi-channel audio, gold-plated connectors, nitrogen-injected insulation, and fully-articulating mounting arms, but they can't compete visually with their big-screen, flat-panel HDTV counterparts.

Despite outward appearances, however, there are a handful of accessories that are vital to getting the most from your HDTV. **LG**

BY ANDREW LEIBMAN

1 **Wall mounts let you display your HDTV to its greatest advantage.** To help you see your TV from the best possible viewing angle, look into a swivel mount, which lets you adjust the vertical and horizontal positions. A wall-mounted HDTV also clears a bit of floor space and keeps your living room or home theater neat and clutter-free. Before hanging the wall mount and installing the television, make sure your theater recliners and couches are positioned where you'll be happy with them for a while so you don't have to drill new holes in the walls every time you want to rearrange the furniture.

2 **TV stands are a good option if you'd rather not drill holes in your family room's newly painted walls.** Likewise, if your walls are made of cement or cinderblock, a stand is probably a better option than a wall mount. Today's A/V furniture manufacturers offer gorgeous, showroom-style stands in a variety of materials, including warm wood (available in many stains), minimalist brushed steel, and clean-looking glass. You can get a triangular corner model, a high-backed cabinet that includes a mount for flat-panel HDTVs, and a rack with adjustable shelves to accommodate the rest of your A/V gear.

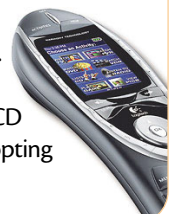

3 **HDMI cables eliminate the need for multiple cables.** HDMI cables are all-in-one cords that carry uncompressed digital audio/video signals to and from your HDTV and its components, eliminating the need for separate A/V cables. Well-shielded cables cost a bit extra, but they're worth it because they eliminate interference from other components. Another feature you'll appreciate on the more costly cables is the connection—because the connector is well-built, it'll fit snugly in the port, so the cable won't work free when pets and small children accidentally jostle the cables.

4 **A surround-sound system brings the aural experience of a theater home.** You've perhaps struggled to keep volume levels steady while watching TV. The intrusion of a loud commercial in the middle of your favorite show is startling; likewise, it's jolting when a quiet part of your favorite movie is suddenly interrupted by a too-loud scene change. A good-quality surround-sound system will feature an equalizer, which will prevent volume extremes in movies and HD broadcasts that are capable of 5.1 or better surround sound.

5 **A universal remote lets you control all of your A/V equipment with one device.** No one—not your mom, dad, grandma, or even the kids—can figure out the remotes when there's a different one for each component in your home-theater system. Consolidate the controls with a programmable universal remote, which lets you control everything with a single device. Many of these devices let you control as many as 15 devices at once, and some have a color LCD with backlighting, so you can see what you're opting to control in your dimly lit home theater.

HDTV Glossary

B

alderdash! OK, HDTV jargon isn't *that* bad, but there are a few terms every shopper should know. Here's your cheat sheet.

aspect ratio—Put simply, it's the shape of the TV's screen. An HDTV has a wider picture than a traditional TV of the same vertical screen height. An HDTV has a 16:9 aspect ratio, meaning that if its screen were 16 inches wide, it would be 9 inches tall. A regular 4:3 TV screen would be 12 inches wide at the same 9-inch height.

HDMI—High-Definition Multimedia Interface is a new type of cable connection. It can carry both high-resolution video and uncompressed, multichannel audio among HDTVs, home-theater receivers, and other components. HDMI cables are pricey, but they maintain top picture and sound quality.

HD tuner—Some more expensive HDTVs include a built-in tuner for receiving local high-def broadcast TV channels. Your TV doesn't need an HD tuner if you have cable or satellite service. Separate HD tuners and antennas are available for HDTVs without them.

interlaced—When an HDTV displays an interlaced image, as in 1080i or 480i resolutions, it really shows you every other horizontal line of a frame of video (called a field) at a time. Sixty times a second, the TV displays the other field of the frame, meaning the lines not shown in the previous field. Interlaced video appears to flicker and causes moving objects on-screen to have blurred edges.

LCD (liquid-crystal display)—Like a notebook's screen, an LCD HDTV uses

a fluid crystal substance to form pixels of color in front of a backlight. LCDs may not be able to match plasma TVs' deep black and gray areas, but they're lighter, sometimes less fragile, and considered easier to set up. LCDs also are catching up to plasmas in size and price and are expected to supplant them in the market.

plasma—Plasma TVs use a tiny tube of gas for each pixel. Electricity makes each pixel glow. Plasmas are still available in bigger sizes than LCDs and create deeper blacks and sometimes brighter colors. However, older or less expensive models can also suffer permanent screen damage if an unchanging image is displayed too long, such as a TV channel's stock ticker or parts of certain video games.

progressive scan—A TV showing a progressively scanned image, as in 1080p or 720p resolutions, displays a full frame of video (both odd-lined and even-lined

fields) all at once. Progressive-scan video looks sharper and doesn't flicker like interlaced images can.

projection—Some large-screen HDTVs offer low-priced alternatives to LCD or plasma by using projection technologies. These technologies vary, but all projection TVs throw light on a screen from the front or rear. This means they are a little to a lot bulkier than plasmas or LCDs, but some rear-projection sets have stellar picture quality.

viewing angle—No matter where you sit in front of an HDTV with a wide viewing angle, such as 170 degrees, its picture should look reasonably good. Test this before you buy.

widescreen—A TV or monitor that's wider horizontally in relation to its vertical height—typically with a 16:9 aspect ratio for HDTVs—than an older 4:3 display.

Goodbye SD, Hello HD

Why An HD Camcorder Is Worth It

These days, HD and TV are like preteens and cell phones: inseparable. But the HD prefix is just as applicable to digital camcorders. Read on for info regarding what makes a camcorder high-def and why you should pay a little extra to make the transition from standard definition to HD with your camcorder.

HD In Your Hand

We all know that an HDTV, combined with the requisite high-def source or content, delivers vastly superior sharpness, color, and detail, but the same can be said with regard to HD camcorders and their ability to record those special moments. Compared to their SD counterparts, HD camcorders let you capture significantly more of the detail in the scenes and people you film. HD camcorders typically cost between \$800 and \$4,000, but you can find bargain models and high-end models that fall outside that range.

For a camcorder to be considered HD, it must be capable of playing, transmitting, or recording video at 720p, 1080i, or 1080p HD resolutions (the “i” and the “p” denote interlaced and

progressive-scan, respectively, which refer to the method by which the images are displayed on a TV). The maximum resolution, or number of horizontal pixels times the number of vertical pixels, that HD camcorders can record is 1,920 x 1,080. Camcorders that can handle this resolution are sometimes called True HD, but some inexpensive HD camcorders record video at 1,440 x 1,080 and 1,280 x 720. By contrast, SD camcorders typically support resolutions up to 640 x 480 or 480i/p.

And Then Some

Superior image quality isn't the only upside to HD camcorders. Almost all HD camcorders let you record in

widescreen format, so you can film the whole wedding party without having to ask them to crowd together. Some HD camcorders also include a multi-channel-capable mic that lets you record 5.1 spatial audio. This feature is useful when shooting large gatherings with lots of people talking at once. For the most part, HD camcorders are capable of recording still images at between 2 and 4MP. Many HD camcorders also feature HDMI ports that let you connect HDMI cables to the unit and to your HDTV for an impromptu instant replay of the baby blooper you just filmed.

Most SD and HD camcorders record video in digital format, meaning they can utilize the same media types, including MiniDV tapes, an internal hard disk drive, DVDs, and flash memory. The big difference between SD and HD camcorders is that an HD variant demands significantly more storage capacity per minute of video.

SD vs. HD Capacity Comparison

If you choose a high quality setting, your camcorder media won't last long. Conversely, a camcorder's lower-quality settings can handle longer recording sessions, but at the cost of image and sound clarity. The values below are approximate; actual quality settings and recording times vary by camcorder model.

Format	Quality Setting	Megabits Per Sec	Video Per 1GB
Standard Definition	Low	3Mbps	43 minutes
	Medium	6Mbps	22 minutes
	High	9Mbps	15 minutes
High Definition	Low	5Mbps	26 minutes
	Medium	9Mbps	15 minutes
	High	15Mbps	8 minutes

The HD Way

When you are looking for a new camcorder to help archive your memories in their most glorious detail, HD is the only way to go. **FG**

Should You Consider A Photo Printer?

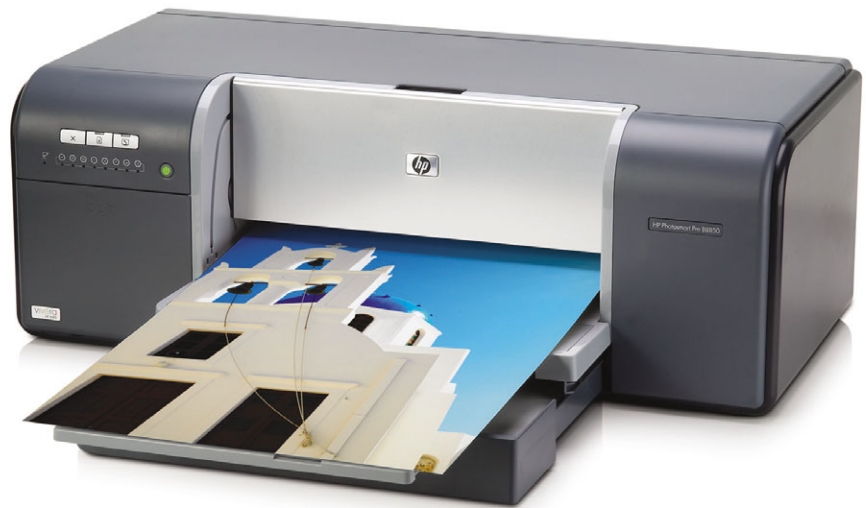

For Convenience & Hands-On Editing, You Betcha

It's a great time to own a digital camera. Several on-line photo-printing services offer passable to superb quality and competitive prices . . . as long as you're willing to wait a week or more for your prints.

If you're more of the do-it-yourself type, you're in luck. Plenty of high-caliber photo inkjet printers await you on the shelves of your local electronics store. Some are traditional inkjets that are really good at making photos, as well as printing documents. Others are dedicated units with special photo-printing features. From the click of your camera shutter to the emergence of a finished print, you can take and print a photo in a matter of minutes.

Faster turnaround is just one of the benefits of a photo printer. Many come with software that allows you to crop, resize, and remove red-eye from your photos using your PC. And some specialized photo printers even come with small color LCDs, memory card slots, and special controls, so you can select, edit, and print your photos without even turning on your computer.

Other features to look for include PictBridge support, which allows you to transfer photos from your camera to your printer via a USB cable; borderless printing, meaning that your photos will run right up to the edge of the paper without white borders around them;

and support for precut, photo-sized paper and specialty papers.

Finally, if you don't like the way a print turns out, you can simply edit it and

print it again. Try that with an online printing service, and you'll be right back to waiting for the mail to arrive. **FG**

Photo Paper For Every Need

Your local office supply and electronics stores should carry inkjet photo paper, which can help make your printed photos look as good as traditional color prints. You'll find a variety of glossy and matte photo paper to suit your needs. Photo paper will make the colors pop and keep the details sharp, unlike run-of-the-mill printer paper.

Photo paper comes in various sizes, too. Many photo printers can handle precut sheets in sizes such as 4x6 or 5x7, which can save you the effort of cutting finished prints apart.

For the best results—vivid prints that won't easily smear, fade, or scratch—it really pays to use the brands and types of paper your printer manufacturer recommends. The reason is that there needs to be good compatibility between the coating on the paper and the ink in a particular printer's cartridges. Don't forget to adjust your printer's settings to the type of photo paper you're using before you click Print.

Essential Things To Know

Digital Imaging

Digital Camcorders

My digital camera can capture video; do I still need a digital camcorder?

ANSWER: Digital camcorders capture video at a higher quality than digital cameras and provide more video-specific controls. If video is your priority, a digital camcorder is the way to go.

Can I transfer video from a digital camcorder to a computer?

ANSWER: Camcorders with a FireWire or USB 2.0 port can transfer video to your PC. With a DVD camcorder, you could insert the disc in the PC's drive and copy the files to your PC.

Will I be able to watch video from an HD camcorder on a standard-definition TV?

ANSWER: Yes, most HD camcorders downconvert the video from high to standard definition. If yours doesn't, you can import the HD footage to your PC and output the video to a DVD.

What recording media offers the longest video recording time?

ANSWER: A hard drive-based camcorder is limited only by its drive capacity, which is often enough for several hours of video. MiniDV and MiniDVDs, at most, can record one to two hours of footage.

Memory Cards

Can I recover photos or data from a damaged or reformatted memory card?

ANSWER: To avoid further memory card damage and better your chances of retrieving lost data, we recommend you take your memory card to a professional for data recovery.

What are Class 4, Class 6, and so on?

ANSWER: These classifications tell you how fast a memory card can save data. For instance, Class 4 SD cards save at 4MBps or faster, whereas Class 6 save at a minimum of 6MBps.

Will a faster memory card speed up my digital camera?

ANSWER: A memory card that saves data faster will allow you to take quicker follow-up shots.

Why do some users advise against ejecting and reinserting CompactFlash cards very often?

ANSWER: CF cards connect to two rows of tiny pins deep inside the card slot. If you insert a card incorrectly, you can bend one or more pins.

Photo Printers

How important is a photo printer's print speed?

ANSWER: Photo printers typically produce 4x6 photos in about 30 to 40 seconds. A slight difference in print speed won't save you much time if you plan on creating only a few prints at a time.

What print resolution should I look for in a photo printer?

ANSWER: Photo printers measure print resolution in dpi (dots per inch), which indicates how many individual dots the printer creates, per square inch, in your photo. The higher the dpi, the sharper your prints will be.

Camera Accessories

What type of camera bag should I buy?

ANSWER: Frequent travelers should consider a backpack or a shoulder case for transporting camera gear on foot. A camera pouch with foam padding will suffice for a compact digital camera user.

What types of paper will work with my photo printer?

ANSWER: Photo printers vary in the types of pre-cut paper sizes they support. Check the users manual to see which sizes of paper the photo printer can handle.

When do I need to use a tripod with my camera?

ANSWER: A tripod will prevent camera shake so your pictures won't appear blurry. Photos that require a longer exposure (in low-light environments, for instance) need stability to capture sharp images.

Can I print images without a PC?

ANSWER: Photo printers that support PictBridge, which lets you connect your digital camera via USB cable to the printer, or have built-in memory card slots will let you print images without a PC.

What's the best way to clean a digital camera lens?

ANSWER: First, use a soft brush to get rid of dust or grit. Remove fingerprints with a lens cleaning cloth or tissue and cleaning fluid designated for a camera lens. Never drop the cleaning solution directly onto the lens.

Can a photo printer read my camera's memory card?

ANSWER: The photo printer will need a built-in memory card slot that's compatible with your digital camera's memory card.

Digital Camcorders

5 Must-Have Accessories

Prices for digital camcorders continue to fall as picture quality increases, which is especially good news for first-time camcorder buyers. As a first-time buyer, you may not have a good idea of what else to include in your camcorder budget. Here are a few accessories we consider must-haves. **FG**

BY THEANO NIKITAS

1

A bag protects your camcorder from potential hard knocks. Whether you have tons of DV gear or only the minimum, a camera bag or case is probably one of the most important investments you'll make. Obviously, a well-padded bag (or a hard case if you need to check your equipment when flying or are taking your gear out on a boat) will protect your camera from knocks and short drops. At the same time, a camera bag can serve as a home for your DV gear; stow all your equipment and accessories in the bag, and you won't have to turn the house upside-down to find that cable or extra DV tape.

4

Experiment with different lens adapters, such as wide-angle or telephoto. Digital camcorders usually have a much broader zoom range than digital still cameras, but if the zoom range isn't broad enough and your camcorder accepts accessory lenses, pick up a wide-angle or telephoto adapter lens. A wide-angle lens is great for tight spots, especially when you're indoors at a party where you may be too close to your subjects to get the full view you'd like. A telephoto lens, of course, allows you to get closer to subjects that are far away, such as performers in a ring at the circus or in rugged terrain when you're searching out wildlife.

2

UV filters are an inexpensive way to keep your lens scratch-free. If your camcorder has a threaded lens, you might want to invest in a UV (ultraviolet) filter. Some people use a UV filter to protect the lens from scratches, as well as dirt, sand, and other outdoor photo hazards, because it's much less expensive to replace a filter than a lens or camera. And, because the filter cuts down on UV light, you'll get clearer and more detailed footage when you're shooting in high-UV conditions, such as in the mountains, so those great landscape shots will look even more impressive.

3

A tripod holds your camcorder steady so guests don't get sick when they watch your vacation video. You may have smooth moves on the dance floor, but can any of us really say that we can hold a camcorder as steadily as we'd like to? Probably not. That's where a tripod comes in. A tripod that's sturdy enough to hold the weight of the camcorder (check the specs) and equipped with a three-way pan/tilt head (the head is the part the camera is attached to) will allow you to smoothly pan the action as your daughter runs up the field to score her winning soccer goal or to follow the path of a bird from the tree up to the sky as it disappears from view. And, if you want a static, steady shot, just put the camera on the tripod, press record, and let it run—just make sure to place the camera and tripod out of harm's way, especially at parties and other group events.

5

Spare batteries ensure that you'll be able to continue shooting your son's baseball game, even when it goes into extra innings. There are times when you'll want to shoot video in the best quality for a fairly continuous amount of time, which can drain the battery. Recharging the battery takes time that you may not have. It's a good idea to have a fully charged backup battery in your case so you don't miss any of the action—whether it's the grand finale of your daughter's piano recital; the final, exciting set of your son's varsity tennis match; or the last hour of your hike in Rocky Mountain National Park.

These Boxes Can Do More Than Record Programs

You've heard the argument, and maybe you've even made it yourself. VCRs have been around for decades now, so what's so special about DVRs? Well, everything. They let you record, pause, and rewind live TV, of course. And they zap through commercials in shows you've recorded with lightning speed, but those are glorified VCR chores. If you really want to know what DVRs can do, read on.

Video Management

Forget about the days of labeling and storing a slew of video tapes. DVRs store video on an internal hard drive—just like the one your computer uses—letting them record anywhere from dozens to hundreds of hours of content, depending on the capacity of the drive and the type of video being recorded. Better still, everything you record is automatically labeled using data from the DVR's built-in programming guide, making it easy to find, sort, and play back all of your favorite shows.

The guides also make it easy to find shows that are interesting and flag them for automatic recording. Most DVRs also incorporate a "season pass" feature that lets you record every episode of an entire series, eliminating the chore of setting up manual recordings each week. It's all so easy that everyone in the family can do it and with no chance you'll record over each other's picks.

Record & Watch

Most DVRs let you play a show you've already recorded as you're recording a live show. Many also come with two television tuners, meaning you can record two shows at once even if they come on at the same time—all while watching a show you recorded last week. This is convenient, for example, if your favorite local and national news shows are on at the same time, and the kids want to watch something they recorded earlier as you're getting dinner ready.

High-Definition Recordings

Many of the latest DVRs can record both standard-definition and HD programs. HD video requires much more storage space than standard-definition video, so you may see two maximum recording times listed in the product's specifications. HD output from the DVR also requires that you

use the proper cables, so be sure to check the “The Right Connection” chart for details.

Surround-Sound Output

An increasing number of shows are broadcast with 5.1-channel surround-sound audio, which most DVRs can record and play back. 5.1-channel audio is set up for common home-theater setups that have three speakers in the front and two in the rear, along with a dedicated subwoofer to produce low bass tones. As with HD video, you need special cables to output the 5.1 audio signal from the DVR, so consult the “The Right Connection” chart for tips.

Networking

DVRs are actually rudimentary computers, and most have networking hardware (or can be used with external networking hardware) to share multimedia content with a networked PC. This is nice because it lets you do things such as view high-resolution pictures on your HDTV that are stored on your PC, set up a playlist for a party on the computer and then play the music over your home-theater setup, or stream home movies directly to your TV without having to record DVDs.

Internet Extras

Network access for a DVR also means that many of them can download content from the Internet. Some have full-blown Web browsers, letting you access any Web site you want to, but most often the feature lets you tap into streaming audio or video feeds so you can access the latest movies or tune into Internet radio

Why Lease When You Can Buy?

Most cable and satellite providers offer leased DVR equipment, but you can also buy a standalone DVR.

The advantage of buying is access to better hardware and superior programming guides. Standalone DVRs tend to come with the best interfaces and often have a host of features (such as expandability) that aren’t supported by leased DVR hardware. If you tend to switch programming providers or think you may switch in the future, buying also guarantees that your hardware will work no matter what provider you use.

stations, which is perfect if you want to relax without having to prep a playlist in another room.

But Wait, There’s More

Now that you know the DVR basics, there are a lot of other useful features to look for while shopping or reading the other articles in this section. For example, if your cable company provides access to CableCARDs, you can use them with certain DVRs to eliminate your cable box and streamline your home-theater setup. Other DVRs have ports on the back that let you attach an external hard drive to increase recording capacity, letting everyone in the family record his or her favorites without running out of space. No matter what kind of DVR you use, you’ll never go back to the VCR days. **FG**

The Right Connection

Getting the best A/V quality from your DVR requires using the proper cables. Use this chart to determine which connection is best for your home-theater setup:

	Video Cables						Audio Cables		
	Composite (RCA)	S-Video	Component	VGA	DVI	HDMI	Composite (Stereo)	TOSLINK (Optical)	Digital Coax
Standard-Definition Video	Yes	Yes	Yes	Yes	Yes	Yes			
High-Definition Video			Yes	Yes	Yes	Yes			
2-channel Stereo Audio						Yes	Yes	Yes	Yes
5.1+ Channel Surround-Sound Audio						Yes		Yes	Yes

Top 5 Things To Know

Before Buying A DVR

1 If you think your only option when it comes to DVRs is to rent one from your satellite or cable company, think again; you can buy one outright from a CE retail store and avoid the monthly fees. Here's what you need to know.

1 Storage capacity. One DVR spec—the maximum hours of content its hard drive holds—is usually easy to find on the box or sales tag. But think of a VCR for a moment. Depending on the recording settings, a standard T-120 VHS tape will hold two, four, or maybe even six hours of material, but as the hours go up, the quality goes down. DVRs usually operate by a similar principle, using selectable levels of video compression to squeeze more onto the drive. For a better sense of the drive's capacity, look for the hours it will hold at the highest quality. If you're looking for an HDTV-compatible DVR, remember that high-definition programming requires around 10GB per hour, which can quickly fill a drive.

2 Connectivity. You'll want to give your recordings the best connection and signal path possible. Currently, the highest-quality (and ostensibly most convenient) connection is HDMI, which carries digital video and audio in a single cable. Of course, you can only use it if your TV (and home-theater receiver, if applicable) has an HDMI input. Still, if your current TV doesn't have it, your next TV is almost sure to. In the meantime, you should be able to use the DVR with another type of connection, such as component video.

3 Programmability. Most DVRs use a built-in electronic programming guide so you can find and select shows you want to record. However, some DVRs require a small monthly subscription fee to use its program guide service. If you opt for a DVR that has a monthly fee, you'll benefit from a continuously updated TV schedule and receive DVR firmware updates. The program guide found in other units is more basic, but it's free and a big leap beyond a VCR.

4 Ready to transfer and burn. DVRs are no longer limited to use with televisions—now they can be hooked up to your computer. Look for a DVR that has the ability to transfer data to PCs, and you'll be able to offload DVR content to your computer's hard drive. Not only will transfers from your DVR to computer help free up your DVR's hard drive space, but you can also watch your recordings wherever you take your PC. After you've moved content to a PC, some DVRs double as a DVD burner, too.

5 Renting. Many cable and satellite providers offer their own DVRs for rent. They're fairly basic, but if you're happy with the feature set, they can be quite economical. For example, an HD set-top converter box can run approximately \$5 per month, but a combined converter/DVR, with dual tuners, can cost around \$9.95 per month. For an extra monthly \$4.95, you can record in high-def while waiting for retail HD DVRs to become more plentiful and come down in price. **FG**

A DVR Dilemma

Is It Better To Buy Or Lease?

One important question to ask when shopping for a DVR is this: Do I buy or lease? Thanks to TiVo, satellite TV providers, cable companies, and CE manufacturers, you have a choice. Your options include everything from a low-cost add-on to your monthly digital cable TV subscription to buying an HD (high-definition) DVD player/recorder with a hard drive.

DVRs let you record a program while watching one you've already recorded. Features vary, of course, but here are some key functions to look for in a DVR or DVR service: an on-screen EPG (electronic program guide), parental controls, sophisticated search tools, scheduling recordings via the Web, and recording an entire season's worth of shows with one command.

One of the best features of a DVR is being able to pause, rewind, and in some cases fast-forward programming. Think of how nice it will be to fast-forward through commercials to watch the funny antics in an episode of "The Office." If you miss the beginning of an episode being recorded, you can rewind to catch the beginning while recording the rest.

If you'd like to get comfortable using a DVR before you buy one, then leasing is probably a wise choice. You can go this route whether you have digital cable or satellite TV.

Digital cable. You may get a DVR when you upgrade your digital cable service. Though terms depend on your cable provider, this is a low-cost option in many markets. Some cable companies lease a DVR for additional monthly fees, and they usually replace a digital TV set-top box. Check with your cable company

about any additional fees, such as installation. You may be able to pick up a DVR set-top box at your local cable office and hook it up yourself, thereby saving any installation charges.

Satellite TV. Satellite companies typically offer subscribers a free upgrade to a DVR for an additional monthly fee.

TiVo. Since its debut in 1999, TiVo (www.tivo.com) has continued to change its subscription packages and upgrade its DVRs. It offers dual-tuner DVRs that let you record two programs at once, with certain restrictions, as well as HD DVRs. (See page 27 for more information on TiVo's HD DVR.) You can hook up a TiVo box to a TV receiving programming via an antenna, cable, digital cable, or satellite, and TiVo DVRs usually work with a broadband connection, although you may need to hook up to a phone line during the initial setup.

Buy Your Own DVR

Instead of leasing, you may buy a DVR to obtain extra features and eliminate monthly fees. Combo units record programs, burn DVDs, and let you watch programs from the beginning, even as you're recording them. Some have an HDMI connection, so you can record and view HD programs on your HDTV.

As you mull over your options, head to your local consumer-electronics store to get a hands-on demonstration. And ask plenty of questions about how your DVRs will work with your home-entertainment system. **FG**

Not Your Typical DVR

You Can Do More Than Record With A Media Center PC

With the last VCR sunk in the tar pit of obsolescence, the component of choice for recording TV programming is now the DVR, as either a standalone unit or built into a cable or satellite receiver.

However, with home computers relatively easy to integrate into home-theater setups, there's an alternative to the standard DVR: a media center PC.

Like a DVR, a media center PC can record and store TV programs. Because it's less specialized, however, it retains the flexibility of a home computer, so you can also enjoy your collections of MP3s, photos, and video downloads; use it for gaming; play DVDs and CDs; and burn them, as well. Connect it to your home network, and you can stream Internet content, surf the Web, and catch up on email.

But is a media center PC the right option for you? It likely is if you're a fan of consolidation and will use the additional features.

The main factor to consider is how you receive your television signal. A media center PC should not have any problem with either

over-the-air or basic cable, even if they're HD. If you get programming such as encrypted premium channels or an HD service tier, you may not be able to record them directly, although some media center PCs have a CableCARD slot for improved cable compatibility. Consult your service provider to find out your options.

It's definitely worth checking into. A media center PC can add a wealth of new choices to your home-entertainment center. **FC**

Turn Your PC Into A Media Center PC

Although you can buy a media PC already decked out for the family room, you may find it more economical to go the do-it-yourself route—especially if you have a spare computer of fairly recent vintage. You'll need to add or upgrade whatever components the computer requires to integrate it into your home-theater system:

Sound card. The card has to be compatible with the inputs in your home theater; ideally, the card supports a digital coaxial or optical line out to carry surround sound.

TV tuner. Whether you have a PCI card or an external USB box, the tuner pipes a TV signal into the PC.

Storage capacity. Don't skimp here. A 400GB drive is common in preconfigured systems; if you'll be recording HDTV, a drive with a full terabyte won't be overkill.

Media center software. You'll use the software to control recording, playback, and browsing. Microsoft's Windows Media Center isn't the only game in town, but it may be the most ubiquitous. Originally, you could get it only on Windows XP Media Center Edition PCs. Now the latest version of Windows Media Center is included with Vista Home Premium and Ultimate editions.

Do You Need An HD DVR?

How To Tell If Your DVR Can Handle High-Def

Y

ou buy a nice HDTV, and your stock as an entertainer goes through the roof. Suddenly, all of your friends want to come over so you can all watch your favorite shows together on the big screen, and you think, “Why not?”

You plan a party, record a few programs from your HD cable feed to your DVR, and send the invites. Everyone shows up, you press Play, and jaws drop—not because everyone’s blown away by your HDTV’s picture, but because they’re stunned that you just paid so much to get worse video quality than they see on their standard-definition TVs back home.

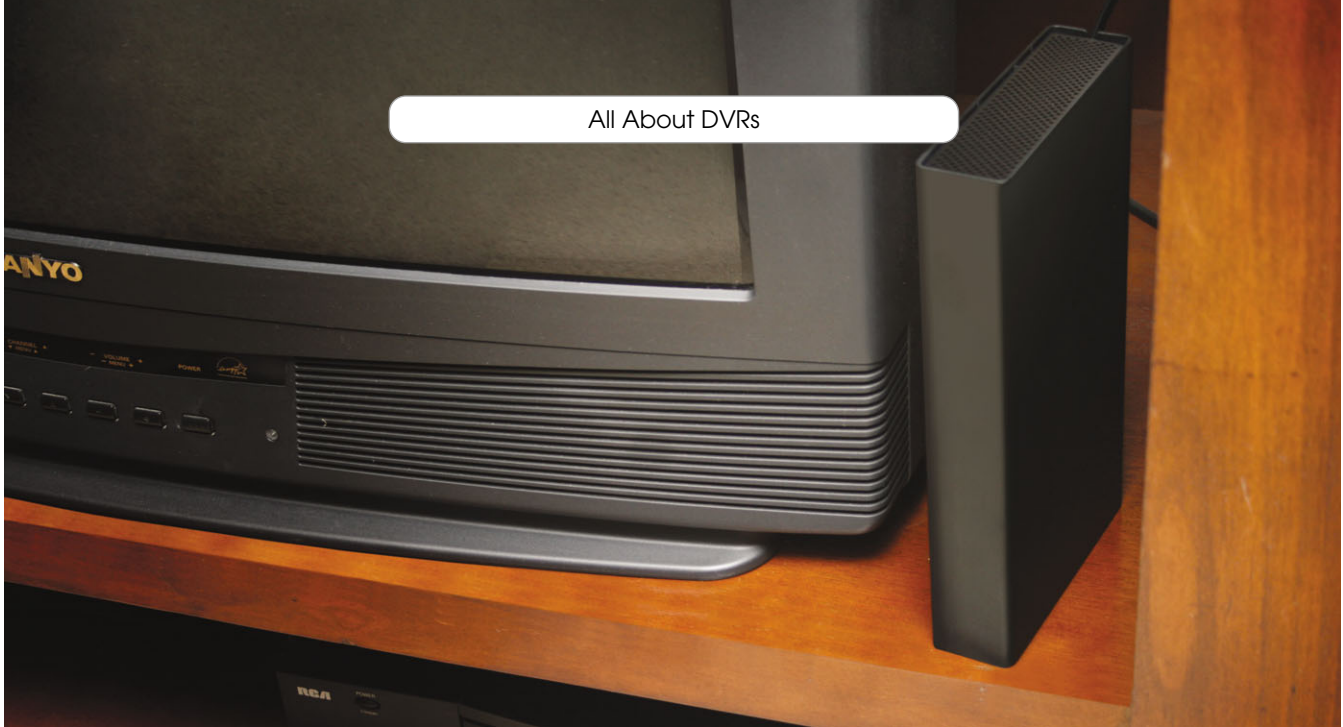

What went wrong? You probably recorded everything using a standard-def DVR instead of an HD DVR. HD video has several times more detail than does standard-definition video, which is why it looks so stunning even on large HDTVs, but all of that extra information comes at a price. HD video requires several times more storage space than does standard-definition video of the same length, and getting that HD video to your HDTV requires special video outputs.

HD DVRs have the extra storage capacity and advanced video outputs you need to record and output HD shows from your cable or satellite provider in all their glory. When shopping for

an HD DVR, pay close attention to the number of hours they claim to record because HD recording times are often a fraction of the standard-def recording times. Look for models with large hard drives—500GB or larger is ideal—and buy only a unit that has video outputs that are compatible with the video inputs on your HDTV. HDMI or DVI connections are ideal, although component video will also carry an HD signal. Avoid S-Video and composite connections whenever possible, as they only carry standard-def video signals, even if the content stored on the HD DVR was recorded in HD.

Devices with two tuners, which let you record two shows at once, are convenient. Another nice option is a CableCARD slot; when you insert a CableCARD from your cable TV provider into the back of the HD DVR, you can use the HD DVR as your cable box. Also, look for HD DVRs that have USB 2.0, FireWire, or other interfaces that let you connect external storage devices to extend the recording time beyond that available out of the box. This lets you buy an inexpensive HD DVR and then spend more if you find yourself recording more than you thought you would. Considering the incredible quality of a HD recording vs. that of a standard-def recording, that’s a distinct possibility, and your partygoers will thank you. **PG**

Extras For Your DVR

D

VRs have become that “can’t-live-without-it” component. Admit it: If you own a DVR, you’ve had to endure the anticipation of knowing your favorite show is simply waiting for you to press Play. Not only have you dedicated your free time to multiple television

programs, but you’re now looking for even more ways to store, save, and watch the latest episodes of “30 Rock.” Fortunately, there are numerous accessories available to enhance your DVR experience. Whether you prefer TV show marathons or a movie on your portable DVD player, you can augment your DVR with devices designed to suit your particular lifestyle. We’ll take a look at a few DVR extras that should help you decide what accessory is most compatible with the way you enjoy your TV programming.

The Episode Devotee

If you record numerous programs, you may have noticed that the DVR’s hard drive reaches its capacity from time to time. As a last resort, you decide to delete your least favorite reruns, but you wish you could archive them for that rainy day episode marathon. Instead of painfully pushing the Erase button, you can invest in a DVR expander. Expanders connect to your DVR via an eSATA interface, which provides quick transfer speeds for external hard drives. Make sure your DVR supports eSATA devices before you buy an accessory such as an expander. Some expanders can store up to 80 hours of HDTV and 300 hours of standard-definition TV.

In terms of space, an expander will add at least a few hundred gigabytes of storage.

The Multitasker

A universal remote control is an ideal device for simplifying the management of a DVR within a home-entertainment system. Modern universal remotes can control everything from a basic TV to home-theater lighting. If you want to control a range of devices, choose a universal remote that supports at least 10 components. Some manufacturers are even designing remotes especially for TiVo devices and programming. DVR fanatics will also appreciate universal remotes that offer a one-touch feature: With a single tap of the screen, instead of pushing multiple buttons to turn on your DVR, you can program the remote to activate a specific function.

The Media Enthusiast

Portable media players are convenient for anyone who likes on-the-go entertainment. Unfortunately, DVRs aren’t so mobile. To bridge the gap between your DVR and media player, use an MP3 player or multimedia dock station that lets you record video from a selected source, such as a TV, and transfer it to your portable media player. If you prefer to take your reality game shows and sporting events on the road, this type of device is ideal for transporting a sizable media library. **PG**

Think Ahead

How To Buy A PC That Will Last

To buy a PC that'll last, consider what you'll use the PC for now and in the future. Newlywed shutterbugs may get by with 100GB of hard drive space and a couple USB ports, but later, that once-ideal PC will stumble under the desire to record a new baby's various firsts in glorious HD. Read on to make sure your new PC lasts for years to come.

Get Choosy With Your Components

Buy the fastest processor you can afford. Opt for a dual- or quad-core processor. In

most cases, you can upgrade processors, but it's expensive. The Velocity Micro ProMagix E8500 Desktop (\$1,499.99; www.velocitymicro.com) features a dual-core processor, but you can upgrade to an Intel quad-core processor later.

If you'll be doing any photo manipulating, video editing, or media encoding in the foreseeable future, get a PC with free memory slots. Many PCs have four slots, but inexpensive models may have just two. DDR3 is the latest memory format, but DDR2 is also current; both are good options. The Velocity Micro ProMagix Q6600 Desktop (\$1,999.99)

includes 2GB of system memory but supports up to 8GB. Also, keep in mind that you'll need Windows Vista 64-bit to utilize 4GB or more.

Get as much hard drive storage as you can afford, but also make sure there are one or more spare SATA (Serial Advanced Technology Attachment) or EIDE (Enhanced Integrated Drive Electronics) ports and room in the case for adding new hard drives. External hard drives are a viable option, but make sure you get a PC with eSATA (external Serial ATA) ports if speed is important to you.

Aside from gaming, the latest graphics cards from ATI and Nvidia also handle the video decoding operations that are necessary to play HD content on a PC. Only settle for integrated graphics if you do little besides surf the 'Net. If you're serious about gaming, make sure the PC has two or more PCI-E (Peripheral Component Interconnect Express) x16 slots and support for multiple graphics cards.

Avoid ultra compacts if you want the PC to meet your needs for years to come; these PCs commonly use proprietary components, which are difficult to upgrade.

Eye On Tomorrow

Nothing in computers is future-proof, but if you buy a PC you can readily upgrade, you can swap parts as your needs evolve. We call that future-resistant. **FG**

Keeping It Clean

Overall Computer Maintenance

In the past, keeping your computer in shape required dozens of utilities, a lot of time, and plenty of expertise. Modern versions of Windows, especially Vista, make it easy to keep a PC running smoothly, using only a few tools and a little bit of know-how. Here's an overview of the three main methods even novices can use to maintain peak performance (not to mention maximum security).

Tip 1: Defragment

The hard drive stores files using small blocks of data called clusters. Ideally, all of the clusters associated with a file or program are located close to one another on the hard drive so they can all be accessed quickly. Often, a file's or program's clusters scatter over the drive's surface, which

makes it more difficult for the drive to read all of the pieces of the files or programs when accessing them.

This process of scattering files is called fragmentation, but you can use a defragmentation utility (such as the one that comes with Windows) to reunite the files and apps and give your PC a speed boost. We recommend defragmenting at least once a month.

Tip 2: Install Antivirus, Antispyware & Firewall Software

No OS is immune to viruses or spyware, which can be used for everything from gathering your personal information to destroying the data stored on your PC. Be sure the antivirus product you install supports automatic updates and scans

all files you download from the Internet (including email). Never install more than one antivirus program on the same PC or they may cause instability or prevent Windows from running.

You can run multiple antispyware products on the same PC, and we recommend using at least two. One should focus on locking down known security holes and passively protecting the system, while the other should focus on scanning for threats and preventing spyware from entering via a Web browser.

Finally, don't forget a firewall. These products monitor your Internet connection to make sure everything coming to or leaving from the PC was specifically authorized by you. Firewalls can stop intruders from the outside from breaking into your network and also prevent viruses or spyware that found their way onto your computer from transmitting personal information to people on the other side of the connection.

When shopping for these types of software, beware of free products that claim to do the same things commercial products do. Some free alternatives live up to their claims, but many require manual updates, expert-level knowledge for configuration, or other things that you don't have to worry about when you subscribe to or buy commercial software.

Tip 3: Keep The Dust Away

Computer hardware runs hot, and it takes a small army of fans to pull cool outside air into the case while expelling hot air from the case. Dust, pet hair, and other detritus buildup in the fan filters or the fans themselves can impede this airflow, causing overheating, which is potentially damaging to components. Every few months, you should remove the computer's case and use a can of compressed air to thoroughly clean inside. **RG**

Leave It To The PC Pros

Best Buy's  Can Get It Done

Today's computers can handle your entertainment, financial, shopping, communication, and business needs like never before. But from the moment you power on your new PC, you'll have to fight spyware, viruses, and online predators; troubleshoot and repair error messages; configure new and old hardware and software; and regularly install updates and patches. Aren't computers great?

Send In The Geeks

Like g-men with pocket protectors, the agents of the Geek Squad (www.bestbuy.com/geeksquad) are there to handle all of your PC setup, repair, and installation needs.

New PC setup and security. The Geek Squad agents can streamline your system with over 100 in-depth tweaks, install and configure security software and other software updates, get rid of unnecessary software that comes preloaded on

your computer, create a restore CD, and even offer secure online storage.

Repairs and upgrades. The Squad team can also unfreeze locked systems, recover data from crashes, and improve poor performance. The Geek Squad's basic service fixes software, removes viruses and spyware, and cleans your PC. You can upgrade to get security and privacy software installed and configured, and you can hire the Geek Squad to upgrade your operating system.

Wireless networking. If you want to communicate more efficiently among multiple computers, the Geek Squad can help you accomplish that, as well as with setting up a PC network in your home; connecting two network-capable devices (such as gaming consoles,

desktop and laptop computers, print servers, and more); and even with securing your wireless network.

Data protection. If you have data you just can't lose (and we all do), the Geek Squad offers both a one-time backup service and an automated backup service. The squad can clean and remove sensitive files from a hard drive you're planning to sell or discard.

Who You Gonna Call?

Once you've made the decision to buy a new PC, you aren't on your own to keep it working. Just call your friendly local Geek. **FC**

Essential Things To Know

Computers

CD/DVD/BD Drives & Burners

What is a “burner”?

ANSWER: Optical drives that can write data to blank CDs, DVDs, and/or BDs (Blu-ray Discs) are called burners because they each use a laser to alter a dye sealed inside a recordable or rewriteable disc.

What’s the difference between “recordable” and “rewriteable” discs?

ANSWER: Generally, write-once discs (CD-R, DVD-R, DVD+R, BD-R) are called recordable discs. Erasable, reusable discs (CD-RW, DVD-RW, DVD+RW, BD-RE) are called rewriteable discs.

Does “write-once” mean that you can only record a disc a single time, even if it’s not full?

ANSWER: You can add data to a partially full CD-R, DVD-R, DVD+R, or BD-R if you enabled the multisession setting in your burning software.

Can I watch BD movies on my PC even if my monitor doesn’t support HDCP?

ANSWER: You can watch BD movies on a legacy VGA monitor without losing picture quality, but if movie studios enable BD’s Image Constraint Token feature, non-HDCP monitors will receive lower-resolution video.

UPSes (Uninterruptible Power Supplies)

Why do I need a UPS?

ANSWER: A UPS protects your computer by providing battery power after a power outage or electrical surge. This enables you to save your work and shut down your system safely.

What are standby and continuous UPSes?

ANSWER: Suitable for home use, a standby UPS uses utility power under normal circumstances, but when that power is interrupted, it will use a backup battery. A continuous UPS will run off constant battery power.

How long does a UPS battery last?

ANSWER: Depending on how many devices you have connected to the UPS, battery power can last approximately 15 minutes or longer. There are UPSes built to sustain power for longer amounts of time.

Notebook Computers

What are the advantages/drawbacks to widescreen notebooks?

ANSWER: Widescreens are ideal for spreadsheet, gaming, and graphics applications and for watching DVDs. However, the screen size adds to the cost and weight of the notebook.

What is 3G connectivity?

ANSWER: Integrated 3G (third-generation) wireless connectivity is a feature common in today's notebooks. It gives users high-speed (2Mbps or more), broadband connectivity and farther-reaching roaming capabilities than previous wireless technologies.

Are there drawbacks to buying an ultra-compact notebook?

ANSWER: Many ultra-compact notebooks lack an optical drive, so you'd have to connect one to an available USB port. They also tend to be more expensive than bulkier models with comparable features.

What does an HDMI-enabled notebook let me do?

ANSWER: It lets you connect your notebook to another HDMI-enabled device, such as an HDTV, and play content—DVDs, digital image slideshows, PowerPoint presentations—from your notebook on the TV.

What kind of card do I need to connect my notebook to a network?

ANSWER: Get a wireless notebook card, such as one based on the 802.11n wireless standard, that's compatible with your notebook. The 802.11n standard carries data at about 300Mbps.

Mice

What are the advantages of a wireless mouse?

ANSWER: With a wireless mouse, your portability and movement won't be restricted by a mouse cord, which can become tangled or caught.

How does a wireless mouse work?

ANSWER: Wireless mice use RF technology, which translates your mouse movements into radio signals. These signals are sent to a receiver connected to your computer.

What is a trackball mouse?

ANSWER: A trackball mouse looks like an upside-down mouse, and it has an external ball that sits in a socket. Your cursor is moved according to the trackball movement you make with your thumb or finger.

What is a USB mouse?

ANSWER: A USB mouse has a USB cord connection. This type of mouse is useful because it is hot-swappable, which means you can plug and unplug your mouse without affecting your PC.

5 Must-Have Accessories

A laptop is a big investment, and now that you've taken the plunge, it's time to decide what you need to go along with your shiny new purchase. We've rounded up five of our favorite accessories that every laptop owner should add to her shopping list. **PC**

BY JOY MARTIN

1 Laptops aren't cheap, so you'll want to protect yours. After splurging on a laptop, the first thing you need to consider is how you're going to protect it. You bought a laptop for its portability, so it's important to buy a good case that can protect it and keep it mobile. Cases are available in a multitude of styles and colors, so you're sure to find one that meets your needs. We especially like laptop bags with wheels and telescoping handles because they're so handy when you are traveling. Look for a bag that is built for your screen size and has plenty of zippered pockets to store your notebook accessories and paperwork.

2 A cordless mouse is easier to work with than a pointing stick. Although laptops are well-suited for working on the go, the pointing stick (that little nub in the middle of the keyboard that lets you navigate the pointer) and/or touchpad that replace your desktop's mouse can be hard to manipulate. If you prefer a mouse, look for a wired mouse that plugs into your USB port or even a cordless mouse. The sleek design makes cordless mice easy to transport, and the USB receivers are small enough to leave plugged in, so your mouse is ready when you need it.

3 Power adapters for laptops will offer your notebook PC some protection from spikes in power. You didn't have to think twice before plugging your desktop PC into a power conditioner or surge protector. But have you taken the same precautions with your laptop? Surge protectors ensure that the electrical current running to the device(s) attached to it doesn't exceed acceptable levels. A sudden spike in electricity can destroy a laptop, so taking the time to plug in to one every time is worth the few seconds it takes. Surge protectors designed specifically for laptops, such as the Kensington Notebook Power Adapter (\$139.99; us.kensington.com), are compact, making them easy to pack away in your laptop bag.

4 Portable USB hubs let you connect a few extra peripherals while you're out of the office. USB ports let you connect all sorts of electronic goodies to your computer, but what if you have more gadgets than ports? A USB hub, such as Dynex's 4-Port USB 2.0 Hub (\$18.99; www.bestbuy.com), is an affordable way to ensure you can connect all of your peripherals. In addition to giving you more ports, cords to items such as a digital camera or music player can be left plugged in on your desk, so they are ready to go next time you use your laptop.

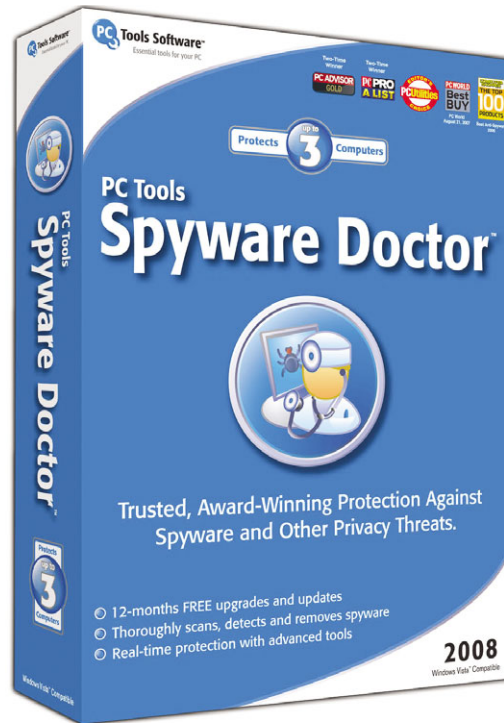

5 An extra battery lets you keep working on the road when you're far away from your recharger.

We love laptops for their portability—they let us work without being tethered to a desk. But that flexibility is limited to how long the battery holds a charge. Having an extra battery on hand that's powered and ready to go gives you the ability to work longer, without having to find an outlet. Batteries vary from laptop to laptop, but with your model number in hand, you can find a replacement for any brand.

Is It Time For A Hands-Free Cellular?

Any list of the great inventions of our time has to include the cell phone. Unfortunately, two great inventions don't always combine as well as strawberries and cream. Take cell phones and steering wheels: Mobile phones have proven to be enough of a distraction in traffic that states are enacting laws to restrict their use while driving.

Because the federal government defers to state jurisdictions, no single policy applies to all cell phone users. Whether you're affected by bans depends on where you are.

Cell Phone Nation

So far, no state has completely prohibited using a cell phone while driving. However, using a handheld phone while in traffic is now banned in six states: California, Connecticut, New Jersey, New York, Utah, and Washington, as

well as the District of Columbia. (The California and Washington bans just went into effect July 1, 2008.) Many other states are considering similar laws.

Another six states—Illinois, Massachusetts, Michigan, New Mexico, Ohio, and Pennsylvania—allow local municipalities to set their own restrictions. Conversely, eight states—Florida, Kentucky, Louisiana, Mississippi, Nevada, Oklahoma, Oregon, and Utah—forbid local jurisdictions from enacting their own cell-phone laws.

Seventeen states, plus D.C., have banned all phone use by teenaged and other novice drivers. However, in most instances where a ban is in effect, the operative word is "handheld." If you're using a hands-free phone, this is no different in the eyes of the law than holding a conversation with a passenger. But even states with the most restrictive laws allow for certain exceptions, such as calls to emergency services.

Further complicating matters, states with phone bans differ on how the police can enforce them. In states where "primary enforcement" applies, an officer can stop drivers if he merely observes them violating the phone law. In states opting for "secondary enforcement," drivers can be cited for a violation only if the officer has stopped them for some other reason.

GPS The One-Way Conversation

It's a comedy staple: a lost driver so engrossed in a map that the next time he looks up, he has a great view of the oncoming trees. But what makes you laugh when it's on-screen isn't one bit funny in real life.

Leave the map to your trip's planning stages. While you're en route, an in-car GPS device can get you where you're going with both hands on the wheel and your eyes on the road. Secure it to your dashboard or upper windshield, input your destination before you leave, and it will verbally guide you through every turn. Because GPS navigators pinpoint your location relative to communications satellites, they're almost always in range of a working signal, whether you're in an unfamiliar part of town or cruising coast-to-coast.

The benefits of an in-car GPS don't end with your destination. If your vehicle is ever stolen, the navigator can help the police track its exact location, although the visible presence of a GPS device may make it less likely to be stolen in the first place. Depending on the unit you select, it may also help you summon aid in case of a breakdown or another emergency; some units have an emergency button, and others can automatically detect a crash and then relay that information to a service center, which pinpoints the car's location and alerts local 911 services.

It may even do all of this for less than the price tag suggests; adding a GPS device could earn you a discount on your auto insurance. ●

Ultimately, the national overview of cell phone laws is a crazy quilt that ranges from firm restrictions in some states to none at all in others. To check the status of your locale, visit the Insurance Institute For Highway Safety (www.iihs.org/laws/cellphonelaws.aspx), which maintains an up-to-date table that lists each state's bans and enforcement level.

Living Within The Law

If you drive someplace where using a cell phone could get you fined, but you can't exist without those in-transit calls, then you better consider going hands-free.

Fortunately, there are enough alternatives that you should be able to find something that suits your lifestyle preferences, starting with a Bluetooth headset that slips onto your ear and goes anywhere you go.

You could also opt for a kit that moves the speakerphone concept from the office to your car. There's a wide selection of options here, from wired phone cradles to wireless systems that let you leave your phone in your pocket or purse. Some units are removable and powered by the car's lighter socket; others require permanent installation in the car's dashboard.

Most units use a built-in microphone, and some let you place calls by voice recognition. Some have their own speakers, and some play the other end of your conversation through the vehicle's speakers, often via an FM frequency on the radio. A few budget options use

wired earphones, although certain states prohibit the use of plugs in both ears.

The most flexible systems, though, are wireless units for Bluetooth-enabled phones. This is the specialty of Parrot, starting with its CK3100 LCD (\$219.99; www.parrot.com/usa), which installs in-dash and features an LCD for quick visual feedback. Parrot's Minikit (\$89.99)

is a portable unit you can shuttle among multiple vehicles or carry from room to room; it's as at home on your desk as it is clipped to your car's sun visor.

Ideally, you'll find something that will keep you in touch while keeping distractions to a minimum. Safe driving! **FG**

Essential Things To Know

Wireless

iPods

Which iPod model will suit my needs?

ANSWER: If you listen to music while working out or when you're on the go, an iPod shuffle or nano will probably be suitable. Music or media lovers should consider the iPod classic or touch.

What accessories are available for iPods?

ANSWER: Armbands, clips, protective cases, headphones, and speaker docks are a handful of iPod accessories. You can also purchase FM tuners, chargers, clock radios, and software.

What will I need to listen to my iPod in my car?

ANSWER: You can enjoy your iPod on the road with an FM transmitter, a cassette or Bluetooth adapter, and direct-connect kits for certain car models.

Which audio formats can I download to my iPod?

ANSWER: You can download and play AAC, Protected AAC, MP3, MP3 VBR, Audible (formats 2, 3, and 4), Apple Lossless, AIFF, and WAV.

Cell Phone Technologies

What is GSM?

ANSWER: GSM (Global System for Mobile Communication) is a cellular phone standard that allows devices to share channels with other devices, with each device having its own time slot. AT&T and T-Mobile use GSM in the United States.

What is CDMA?

ANSWER: CDMA (Code-Division Multiple Access) is a cellular phone standard. Unlike GSM, CDMA does not assign a specific frequency to each user. Sprint and Verizon Wireless use CDMA in the United States.

What is EVDO?

ANSWER: EVDO (Evolution Data Optimized) is a wireless broadband networking service that gives you high-speed Internet access on your cell phone without the need for a wireless access point.

What is HSDPA?

ANSWER: HSDPA (High-Speed Downlink Packet Access) is a GSM mobile telephone protocol that provides high-speed Internet access on your phone. HSDPA is faster than EDGE and supports up to 14.4Mbps in the downlink and 2Mbps in the uplink. AT&T currently offers HSDPA in the United States.

What is EDGE?

ANSWER: EDGE (Enhanced Data for GSM Evolution) is a digital mobile phone technology that provides high-speed Internet access on your cell phone. EDGE can transmit data at rates up to 384Kbps and is therefore slower than HSDPA. AT&T offers EDGE coverage in many places where HSDPA service is not yet available.

Headphones

Are wired headphones better than wireless headphones?

ANSWER: Wired headphones will offer a better connection than wireless headphones because your audio will suffer less signal degradation. Nevertheless, there are wireless headphones that can deliver excellent quality audio.

What is Active Noise Cancelling?

ANSWER: Headphones equipped with noise-cancelling technology detect ambient noise and generate a tone to cancel it out. This creates a clearer sound in your headphones, so you can enjoy your music even in somewhat noisy environments.

What sets Dolby Surround Sound headphones apart from other headphones?

ANSWER: Headphones with Dolby Surround Sound technology let you listen to audio with virtually the same surround-sound effects you'd experience in a 5.1-channel surround-sound home theater.

Can you damage your hearing with headphones?

ANSWER: You can damage your hearing with headphones, but you can take precautions to prevent this from happening. Keep your audio volume at a comfortably low level, and your hearing shouldn't be affected.

Smartphones

Do I have to lock into a service plan to get a smartphone?

ANSWER: The type of plan you get depends on which provider you choose. Some require a contract, typically for one or two years; others don't.

Will any OS work with any kind of smartphone?

ANSWER: Most smartphones use a proprietary OS. Symbian is the most common worldwide but not in the United States, where Windows Mobile, RIM BlackBerry, Linux, iPhone, and Palm are more prevalent.

Will my smartphone work overseas?

ANSWER: That depends on your phone's network: CDMA (Code-Division Multiple Access) networks work in North and South America. GSM (Global System for Mobile Communications) networks operate worldwide. Check with your service provider for options and ask if roaming charges apply.

How do I transfer data from a computer to a smartphone and vice versa?

ANSWER: The specific transfer method depends on the phone. Generally, smartphones transfer data via a USB cable, dock, or cradle. Some phones sync information wirelessly via Bluetooth or Wi-Fi technology.

What sets an iPhone apart from other smartphones?

ANSWER: The phone has more than 300 patents and features one of the slimmest form factors on the market. Additionally, you access its menus and control all of its features through the touchscreen.

MP3 Players

5 Must-Have Accessories

Nailing down a list of must-have accessories for an MP3 player is tricky. Just because an iPod dock for the kitchen tops your list, for example, doesn't mean it even cracks an avid jogger's Top 5. Ultimately, though, five general categories stand out, although other notable accessories include extra batteries, cleaning kits, and Bluetooth adapters. **FG**

1

Match your earphones to your needs. Sometimes a runner doesn't fare well with earbuds, which fall out due to the constant jostle of running. This is a burden for anyone hoping to get in a good workout. A runner should opt for headphones that are secure, and in this case, an in-the-ear earbud would be the ideal choice. Headphone styles are numerous and include wired/wireless earbuds, which are perfect for people on the go (students, mass-transit users), and earcups, which can satisfy any audiophile's need to hear minute musical details.

2

Portable speakers and docks are perfect for letting the entire group listen to tunes in open areas. Whether you want to listen to Enya as you take shelter from a summer squall or need some musical motivation as you weed, feed, and mow the lawn, there's no limit to where you can listen to your portable player. Don't let the pair of headphones that came with your player constrain you, either. Most speakers have a dock to recharge your player's battery. Check your MP3 player manufacturer's Web site for model numbers of available speakers and docks.

3

Beam the tunes on your portable music player through your car stereo. If you're motoring about in the family van, music players can provide the soundtrack. You'll need an FM transmitter that plays the tunes on your portable music player over your car radio. Connect the transmitter to your player, select a designated frequency on the radio, tune to that same frequency on your transmitter, and listen to music, movies, podcasts, audio-books, etc. Transmitters range from basic to sophisticated models (providing remote controls and visual interfaces), making it easy to find one that suits your needs.

4

Cases can protect your portable music player from scratches, bumps, water, physical drops, and mishaps that can otherwise shorten your player's life. You decided to treat yourself and buy a high-end MP3 player. Because you've already spent so much, it's only right to assume that you have everything you need, right? Not quite. No matter what type of portable music player you own, it's wise to buy a case to protect it in different environments. Cases are relatively inexpensive (around \$20 and up) and can provide a little protection from minor drops or normal wear and tear. Because cases are designed to work with specific players, check the MP3 player manufacturer's Web site for cases that are compatible.

5

Armbands can mean the difference between a workout you're proud of vs. one that is constantly interrupted by accidental drops and tugging, tangled cords. Without a doubt, music is a huge motivator when it comes to exercise. No matter your sport, an armband that fits around your bicep offers stability for your portable music player and comfort for you. And for workouts that don't jostle your player, such as riding an exercise bike, a lanyard provides an inexpensive, effective alternative to an armband.
